 wisely stress containment of Guinea worm infections and Abate application, since both
 interventions prevent Guinea worm-infected copepods in water, and neither intervention will be
 perfect. It is similarly challenging to detect and treat all at-risk water sources with Abate correctly
 and on time as it is to discover and contain Guinea worm-infected animals and people in time
 to prevent transmission. 2 I SHUVRQV LQWHOYLDZG G HLYQ DIF, WLVHIDV
